

ASSIGNMENT – 13

NAME: K.VENKAT

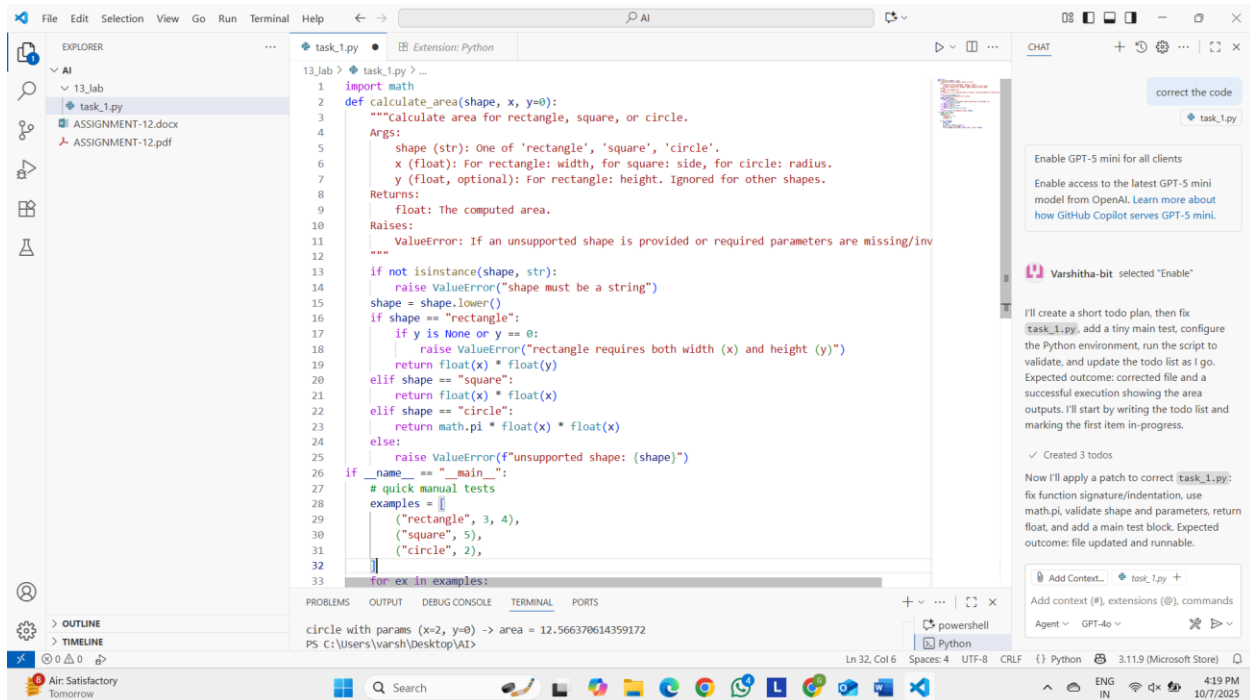

HT.NO: 2403A52053

BATCH: AIB03

Task-1:

Prompt: correct the code.

Code:

The screenshot shows a Visual Studio Code editor with a Python file named `task_1.py`. The code defines a function `calculate_area` that takes a shape and dimensions as input and returns the area. The code includes comments and docstrings. A chat window on the right side of the editor provides feedback and suggestions for improving the code.

```
13_lab > task_1.py > ...
1 import math
2 def calculate_area(shape, x, y=0):
3     """Calculate area for rectangle, square, or circle.
4     Args:
5         shape (str): One of 'rectangle', 'square', 'circle'.
6         x (float): For rectangle: width, for square: side, for circle: radius.
7         y (float, optional): For rectangle: height. Ignored for other shapes.
8     Returns:
9         float: The computed area.
10    Raises:
11        ValueError: If an unsupported shape is provided or required parameters are missing/inv
12    """
13    if not isinstance(shape, str):
14        raise ValueError("shape must be a string")
15    shape = shape.lower()
16    if shape == "rectangle":
17        if y is None or y == 0:
18            raise ValueError("rectangle requires both width (x) and height (y)")
19        return float(x) * float(y)
20    elif shape == "square":
21        return float(x) * float(x)
22    elif shape == "circle":
23        return math.pi * float(x) * float(x)
24    else:
25        raise ValueError(f"unsupported shape: {shape}")
26 if __name__ == "__main__":
27     # quick manual tests
28     examples = [
29         ("rectangle", 3, 4),
30         ("square", 5),
31         ("circle", 2),
32     ]
33     for ex in examples:
```

Chat window content:

correct the code

task_1.py

Varshitha-bit selected "Enable"

I'll create a short todo plan, then fix `task_1.py`, add a tiny main test, configure the Python environment, run the script to validate, and update the todo list as I go. Expected outcome: corrected file and a successful execution showing the area outputs. I'll start by writing the todo list and marking the first item in-progress.

✓ Created 3 todos

Now I'll apply a patch to correct `task_1.py`: fix function signature/indentation, use `math.pi`, validate shape and parameters, return float, and add a main test block. Expected outcome: file updated and runnable.

Output:

Observation:

First when we write the code in the work space, then when we give the prompt to correct the code it immediately changed the whole code. The original code was hardly 6 lines but the generated code is more lines. It even included comments so that we can understand the code easily. Now the code is in a correct structure.

Task-2:

Prompt: Correct my mistake

Code:

Output:

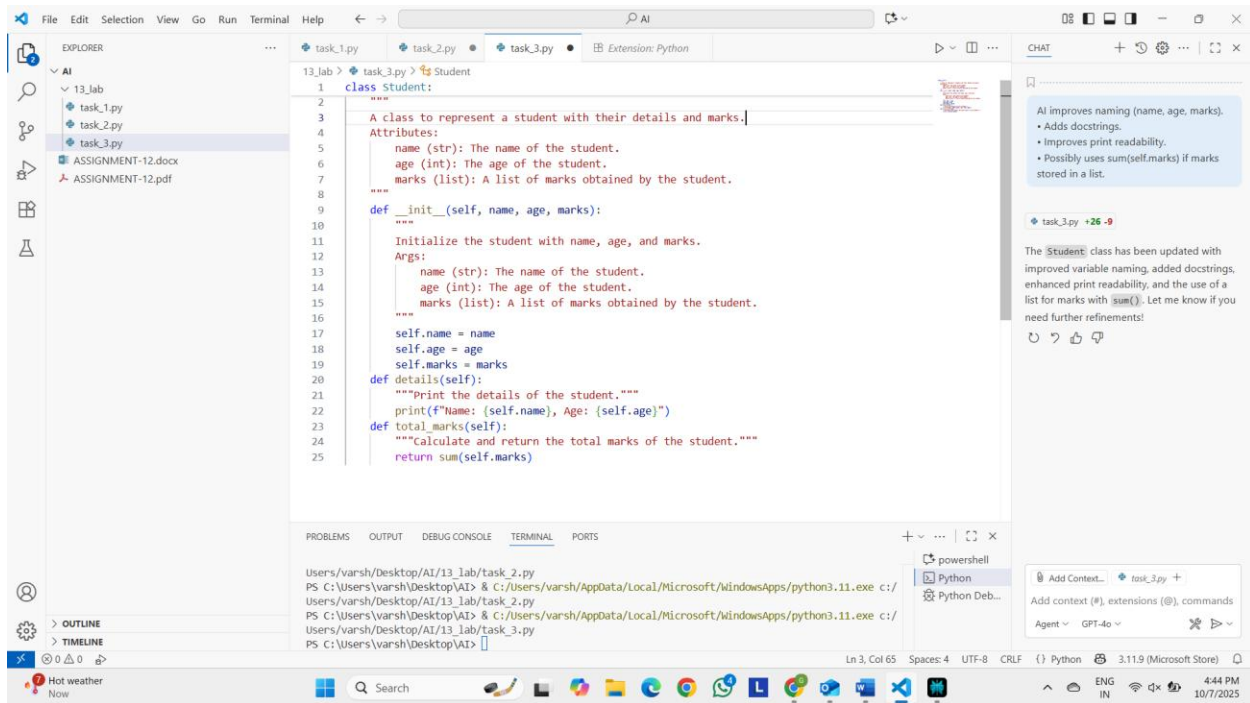

Observation:

In the give code we did not give a code with proper indentation. And file handling was also not perfect. But as we gave the prompt to correct it. It handled all that issues.

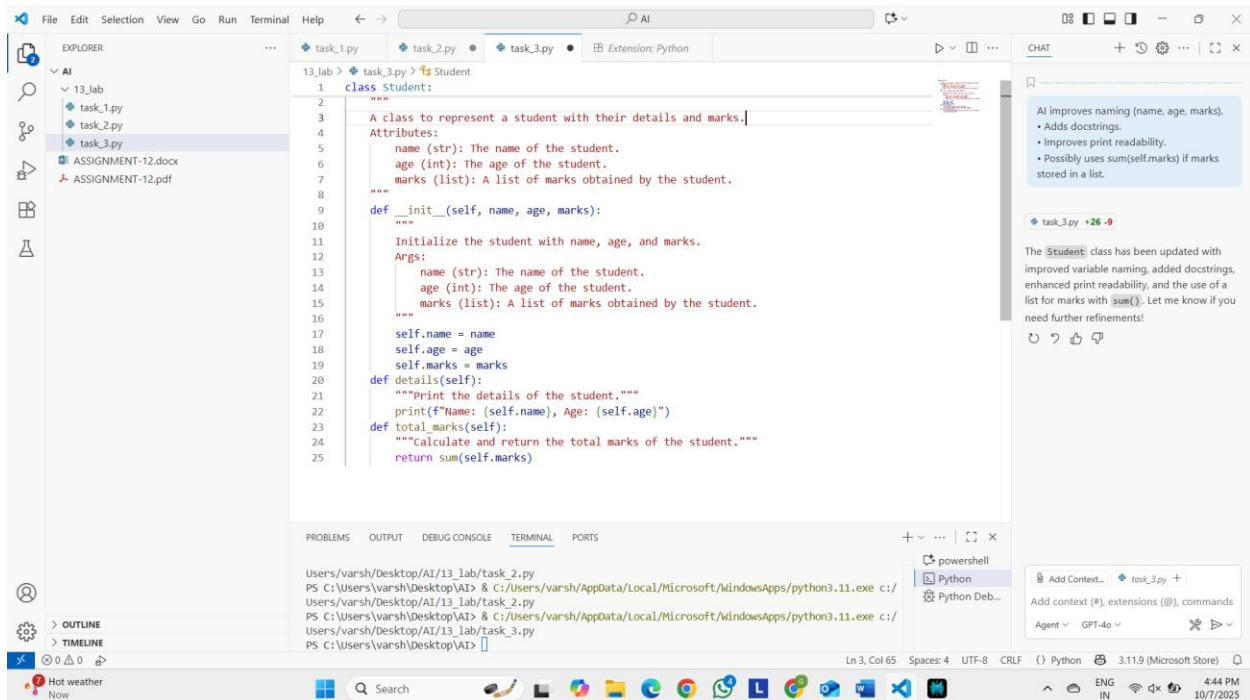

Task-3:

Prompt: correct my code. In this the attributes are name, age and marks.

Code:

Output:

Observation:

First when we write the code in the work space, then when we give the prompt to correct the code it immediately changed the whole code. The original code was hardly 6 lines but the generated code is more lines. It even included comments so that we can understand the code easily. Now the code is in a correct structure

Task-4:

Prompt: Correct my mistake

Code:

Output:

Observation:

First when we write the code in the work space, then when we give the prompt to correct the code it immediately changed the whole code. The original code was hardly 6 lines but the generated code is more lines. It even included comments so that we can understand the code easily. Now the code is in a correct structure
